## CHAPTER 24 - CYCLE COUNTING

Cycle counts are logical counts of selected items or locations that allow the user to verify those logical counts against warehouse physical counts.

### Cycle Count Request

These screens will allow the user to define parameters for a cycle count at a template. The user also has the option to create cycle counts tasks immediately.

From the Requests Menu, select Update Requests, and then click on Cycle Count.

The screen will display as follows:

The screenshot shows a software window titled "Cycle Count Request for Facility A". It has two tabs: "Criteria" (selected) and "Results". A toolbar at the top right contains navigation and action icons. The main area has a "Description:" label above a dropdown menu showing "CCC Keyboard Special Count". Below this are several input fields: "Customer ID:" with a text box containing "CCC", "Item:" with a text box containing "KEYBOARD", and "Lot:" with an empty text box. Each of these three fields has a small edit icon (pencil) to its right. Further down are "From Location:" and "To Location:" text boxes, each with an edit icon. At the bottom of the input section are "Zone:" and "Location Type:" text boxes, with the latter having a dropdown arrow and an edit icon. At the bottom of the window, there are three buttons: "Process" (with a green checkmark icon), "Generate..." (with a printer icon), and "Out of Service" (disabled). A status bar at the very bottom reads "Facility A (Last Update by SWINCHELL at 9/27/00 2:17:02 PM)".

### Cycle Count Request/Criteria

Decide on whether to use an existing template or if a new one needs to be created.

**HINT:** To help make the decision, view existing templates by positioning the cursor in the description field and double clicking to view the drop down box.

Select an existing template by double clicking on the specific template or create a new one by clicking on the .

If creating a new template, enter a description of the cycle count to be performed. This is a free text field. The description should be of some meaning of identification to the user. Skip this step if an existing template, is being used.

Tab to the customer field. In the customer field, type in the customer ID. If the customer ID is unknown, double click and a drop down box will appear.

To request counts for a range of locations, enter location ID's in the From and To Location Boxes. Leaving the To Location field blank will only create tasks to count at that location.

To generate a request on a specific customer, item, zone, location type, or lot, enter that information in the specific field. Leave all the other fields blank. These are considered "more specific parameters". They have an "and" relationship. Only if all non-blank parameters are fulfilled, the results will include the location(s) entered in Step 6.

**HINT:** When using an existing template and changes are needed to any of the criteria (item etc.), after changing the information, click on the  to update the information.

Click on the  button to have SYNAPSE handle the request.

The screen will display as follows:

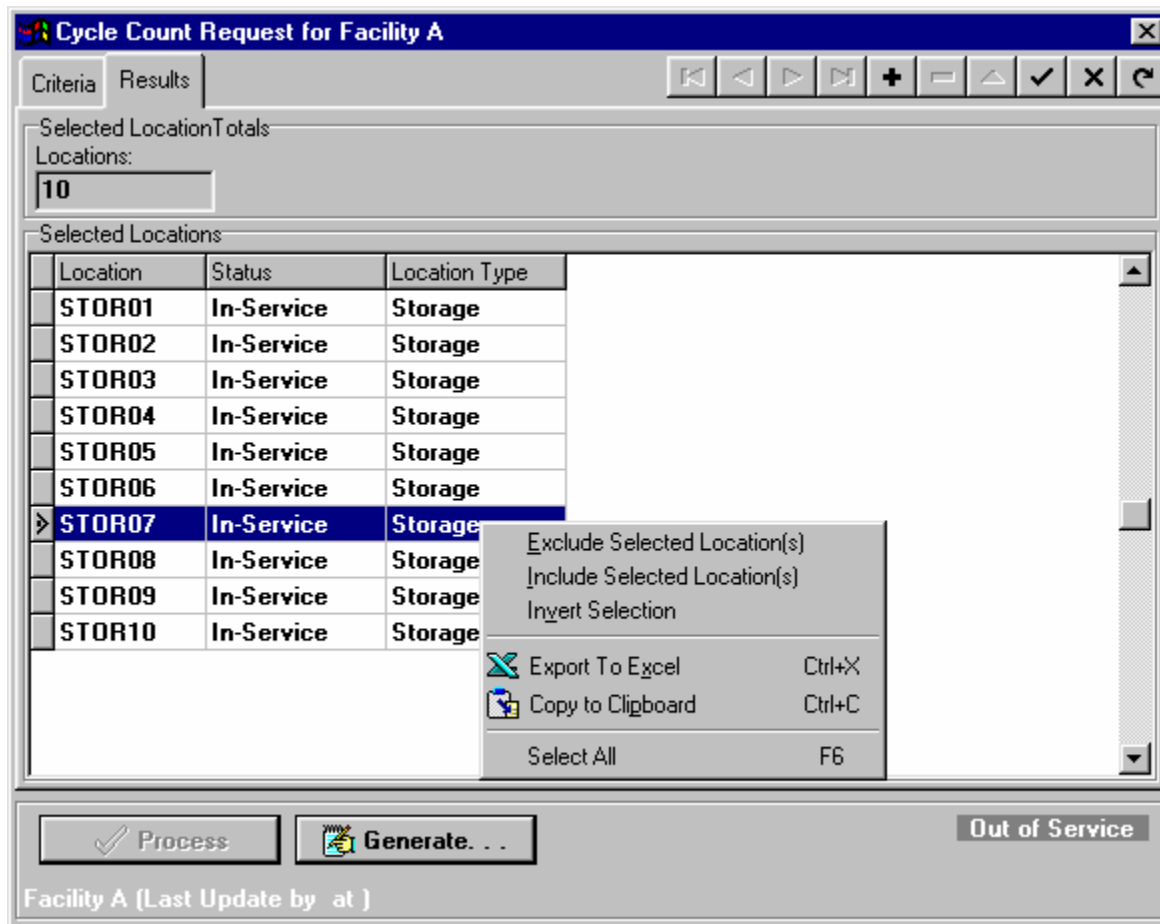

Location	Status	Location Type
STOR01	In-Service	Storage
STOR02	In-Service	Storage
STOR03	In-Service	Storage
STOR04	In-Service	Storage
STOR05	In-Service	Storage
STOR06	In-Service	Storage
STOR07	In-Service	Storage
STOR08	In-Service	Storage
STOR09	In-Service	Storage
STOR10	In-Service	Storage

## Cycle Count Request/Results

On the Results Tab, SYNAPSE will display the outcome of the request.

Review the results. Note that the shaded Locations box in the upper right will display the total number of locations returned by SYNAPSE processing.

The Results screen will display as follows:

To include or exclude locations to be counted, right click the mouse. Highlight the row on the grid to be processed and select the Exclude Selected Locations(s) options. Continue until desired rows are processed. To do the reverse, select the Invert Selection option and then highlight a row on the grid, and select the Include Selected Location(s) option. Continue until desired rows are processed.

Review the results of the request. If acceptable, click on the  button to build the cycle count tasks.

A message window will display stating the generation of cycle counts is complete:

Click on the “OK” button when the cycle count generation is complete.

## Generating Cycle Counts from RF

The RF also has the ability to request a cycle count. To perform this option, the RF operator accesses the Location Inquiry screen (RF Option 98). Once in the screen, the RF operator presses F6.

## Performing the Cycle Counts via the RF system

Select Work (option 30) from the SYNAPSE RF Main Menu.

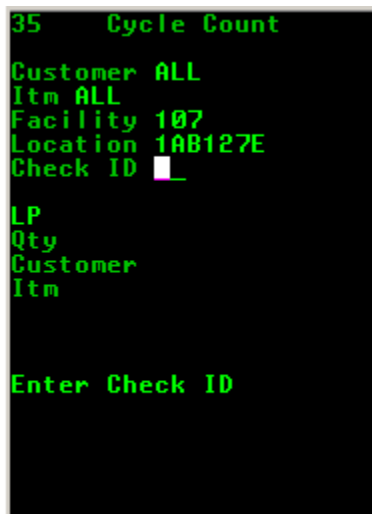

The Work Menu will display as follows:

Select Cycle Count (option 35) from the RF Work Menu.

- SYNAPSE will assign a cycle count task based on the order that was entered into the system, the location of the user and the priority of the cycle count tasks.

The Cycle Count screen will display as follows:

```
35    Cycle Count
Customer ALL
Itm ALL
Facility 107
Location 1AB127E
Check ID 
LP
Qty
Customer
Itm

Enter Check ID
```

Proceed to the location indicated. Enter or scan the location Check ID.

Scan in the LP. If the location is empty, press the F4 key.

Count the item and enter the quantity in the QTY field.

Scan or type the Customer ID in the Customer field.

Scan or enter the Item ID in the Itm field.

Hit the Enter key. If any other attribute is required, such as Lot number, the user will be prompted to enter this information also.

```
35    Cycle Count
Customer ALL
Itm ALL
Facility 107
Location 1AB127E
Check ID 00

LP 0000000000255519
Qty 30
Customer ccc
Itm red mouse
LOT red
_____

LOT required
```

Continue counting the location until all the items have been counted and entered.

When the count task for the location is complete, hit the F4 key.

```
35    Cycle Count
Customer ALL
Itm ALL
Facility 107
Location 1AB127E
Check ID 00

LP 
Qty 
Customer 
Itm 
LOT 

Enter. F4-Done
```

The system will ask the user to confirm that the counting is done, enter Y at the “Count Done ?” prompt.

```
35    Cycle Count
Customer ALL
Itm ALL
Facility 107
Location 1AB127E
Check ID 00

LP
Qty
Customer
Itm
LOT

Count Done?y
```

If the user did not count an LP that Synapse expected, the user will receive a message, 'Remove LPs?'. This message lets the user know that there is an LP that is unaccounted from the count in the location. If the user realizes that they missed a pallet, then the user can answer 'N' and continue to enter the LP and information. If the user has entered all of the LP's, then the user can answer 'Y'. The system will remove the missing LP from the location and put it into a location called SUSPENSE. It does not remove the LP from inventory. See section on Suspense for further details.

```
35    Cycle Count
Customer ALL
Itm ALL
Facility 107
Location 1AB127E
Check ID 00

LP
Qty
Customer
Itm
LOT

Remove LPs?
```

If the quantity entered on the count is different than what Synapse expected, the user will receive a message 'Confirm Count'. This lets the user know that there is a discrepancy. If the count is correct, the user presses enter to continue. If the count is not correct, the user can make the necessary changes and then press enter.

```

35    Cycle Count
Customer ALL
itm ALL
Facility 107
Location 1AB127E
Check ID 00

LP 000000000255519
Qty 30
Customer ccc
itm red mouse
LOT red

Confirm count

```

**HINT:** To view the cycle count tasks, select **Lookup** from the main menu and click on **Tasks**.

Task for location “STOR07” exists.

The screenshot shows the 'Task Information' window. At the top, there are input fields for Facility (A), Priority, Task Type (CC), From Section, From Location, Customer ID, Order ID, Load, Wave, and To Location. To the right of these fields are checkboxes for a green checkmark and 'On Hold'. Further right are fields for Task Count (5), Quantity (0), and Labor (00:00). Below these fields is a tabbed interface with 'Tasks' and 'Sub-Tasks' tabs. The 'Tasks' tab is active, showing a table of tasks.

Facility	Priority	Task Type	Assigned To	From Location	From Section	To Location	LiP	UOM	Qty	Item
A	Normal	Cycle Count		PF03	03					
A	Normal	Cycle Count		PF05	03					
A	Normal	Cycle Count		STOR07	04					
A	Normal	Cycle Count		STOR08	04					
A	Normal	Cycle Count		STOR10	04					

Task Information Screen before the example.

**Task Information**

Facility:  Priority:  Task Type:  From Section:  From Location:

Customer ID:  Order ID:  Load:  Wave:  To Location:

Task Count:  Quantity:

Labor:

☒ On Hold

Facility	Priority	Task Type	Assigned To	From Location	From Section	To Location	LiP	UDM	Qty	Item
A	Normal	Cycle Count		PF03	03					
A	Normal	Cycle Count		PF05	03					
A	Normal	Cycle Count		STOR08	04					
A	Normal	Cycle Count		STOR10	04					

Task Information Screen after the example:

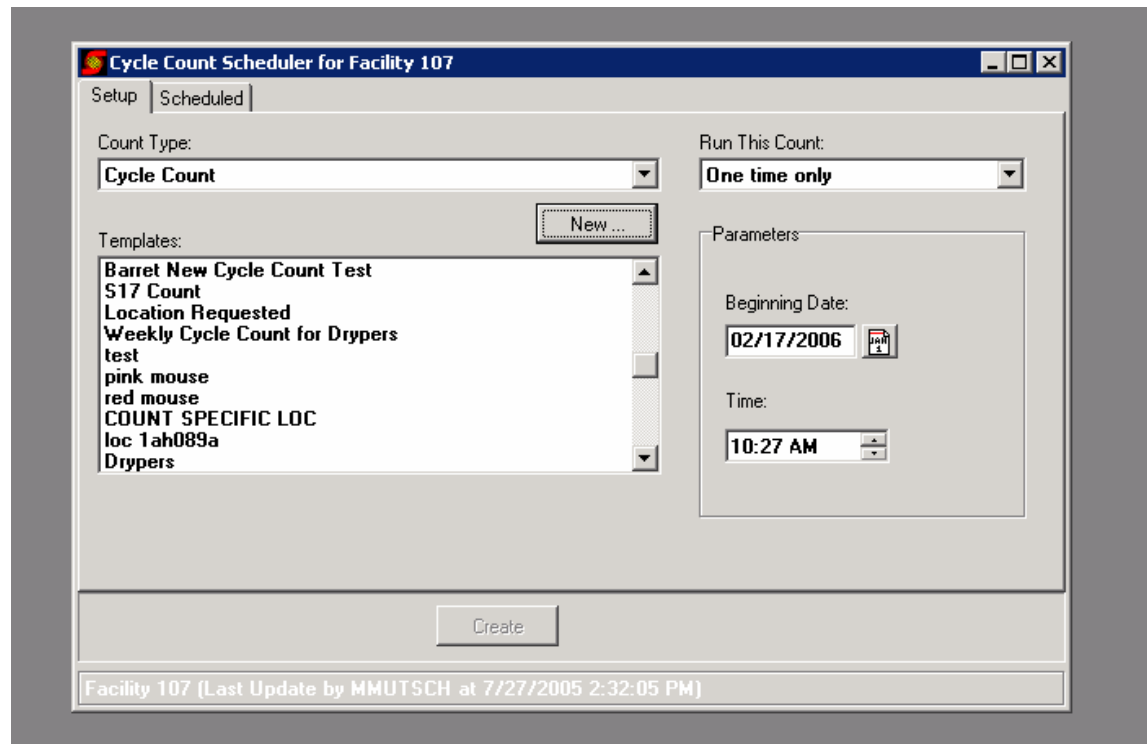

Notice that the task for location “STOR07” is no longer displayed.

## Using the Count Scheduler

Cycle counts can be scheduled in advance for a one-time request or on a regularly scheduled basis such as monthly, annually, etc. The user can select the criteria for the count, and set a starting date and time for the tasks to be generated.

From the Requests Menu, select Update Requests, and then click on Count Scheduler.

The screen will display as follows:

## Cycle Count Scheduler/Setup

Select the count template desired. These same templates were viewed in the Request Screen. To create a new template, click on the **New ...** button and Synapse will switch to the Cycle Count Request Screen discussed earlier in this section.

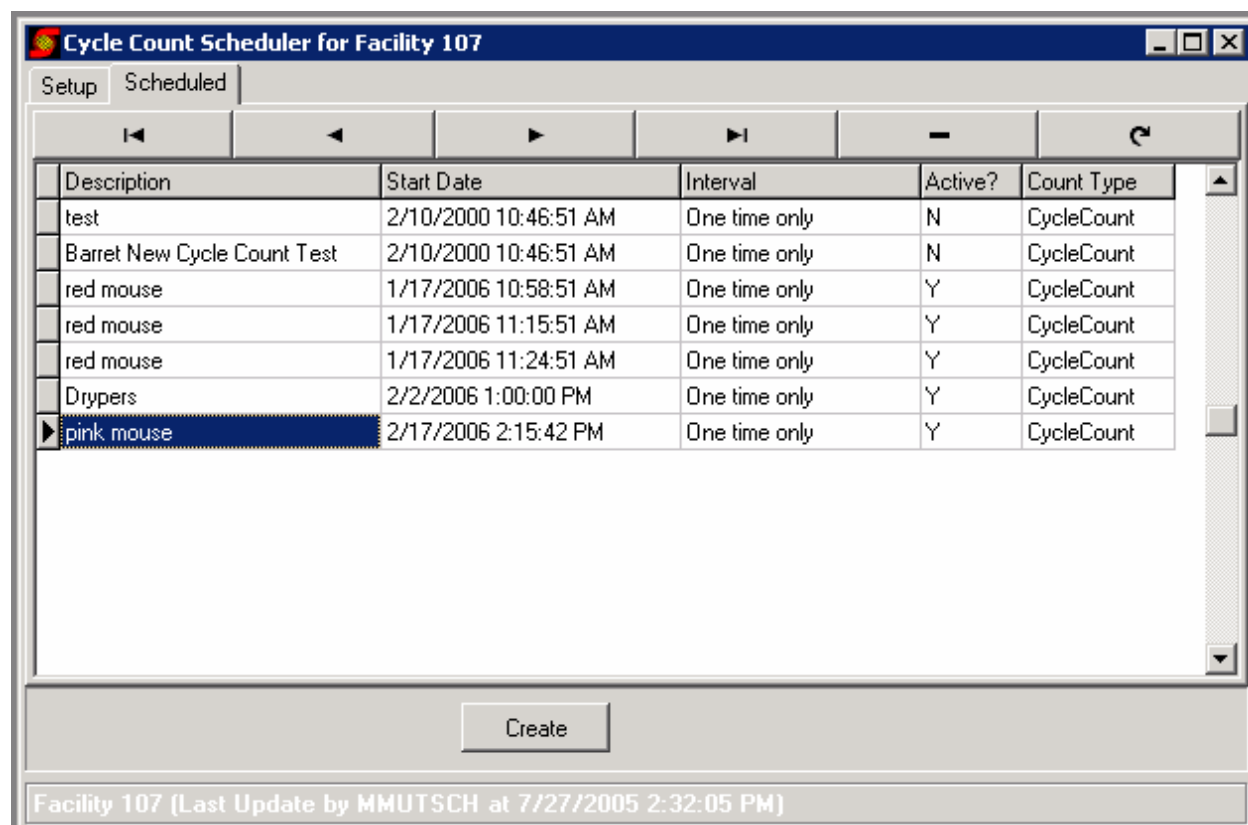

Select an interval for the count execution as shown above under the "Run This Count" heading. If an interval other than "One Time Only" is selected, the count will execute at the specific interval indefinitely, or until deleted.

Set the beginning date and time.

Click on the  button. This will generate a schedule with the specified parameters. If this is a recurring request, the next request will be scheduled automatically after this request is executed.

- To view scheduled requests, select the Scheduled tab.

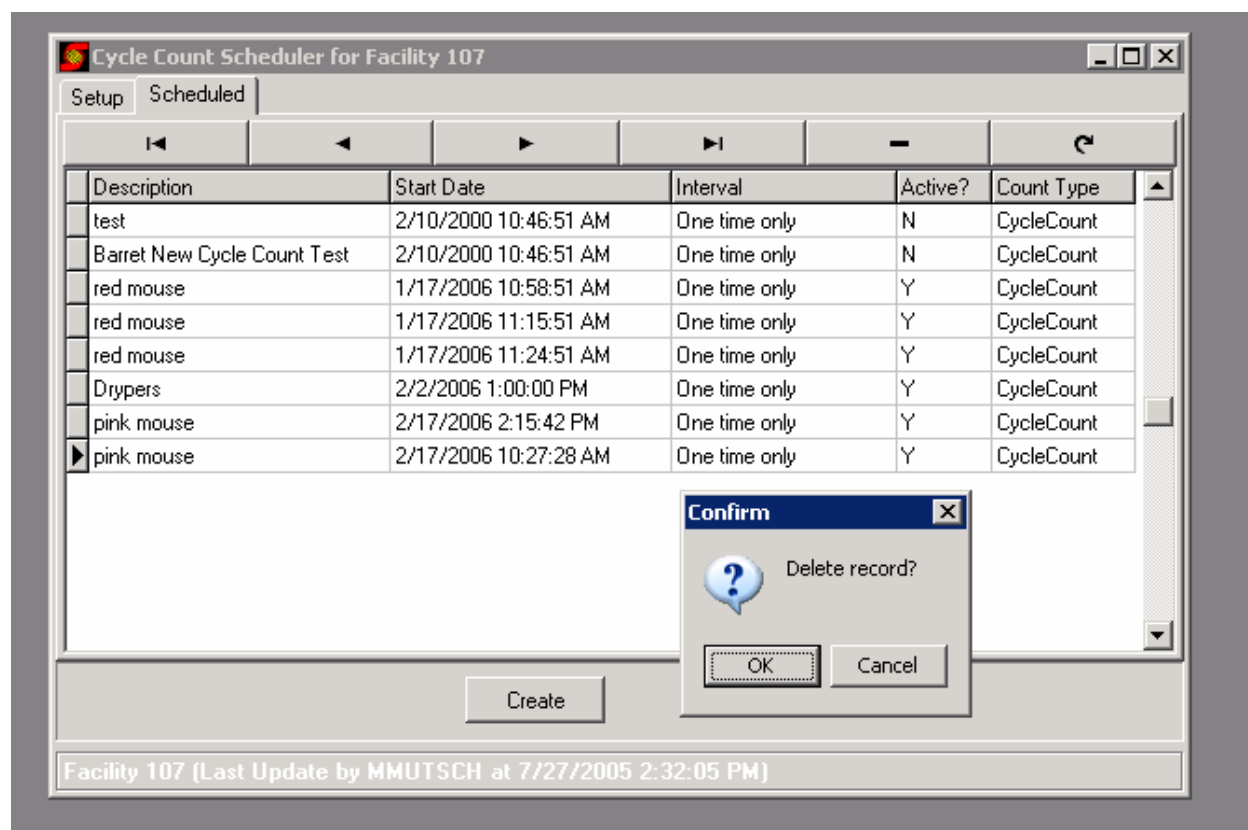

The screen will display as follows:

## Cycle Count Scheduler/Scheduled

This screen displays a list of current scheduled counts, including the template description, start date, interval and count type.

Selecting one of these rows and using the "-" symbol on the task bar the user can delete the schedule. Navigate through the rows or delete a row via the toolbar at the top of the panel.

## Suspense

The Suspense location is used by the system to offset discrepancy values from a cycle count. This allows inventory control to have visibility and correct discrepancies from one LP or location to another. As an example, the system expected the user to count 30 cs from LP 255519, but the user only counted 25. The existing LP is reduced to the quantity of 25 and a system generated LP is entered into Suspense for a positive value of 5 (the system did a negative(-) on the LP and a positive(+) to Suspense). The overall total of the item is still 30 cs. These entries remain in Suspense until they are either cleared by another cycle count or removed as an adjustment to inventory.

## Require Cycle Count Item Processing

This processing allows the option to see the item and customer for a cycle count. "Require Cycle Count Item" checkbox to Customer Maintenance, Item Maintenance and Product Group Maintenance is available.

When the user cycle counts LPs, they all see the same screen and \*can\* enter the same fields as for regular cycle counting. If the user does not enter an item (and customer) and the "Require Cycle Count Item" is set for the item on the LP, an error message will appear (as in regular cycle counting). **If the flag is not set,** then the customer, item, description and lot are displayed and the user can either just hit enter or override any of the fields (except for description).

When the user cycle counts a pick front, the system will pre-fill the customer and item if the flag is not set for the first item for which the location is a pick front. The user can override any of the fields. After enter is pressed, all enterable fields are blanked and the user can either enter more or just press F4 to complete the count.

▶ RED MOUSE	10/21/2005 10:20:08 AM	CCC	107	1AA053A	30	Available	Available		Each

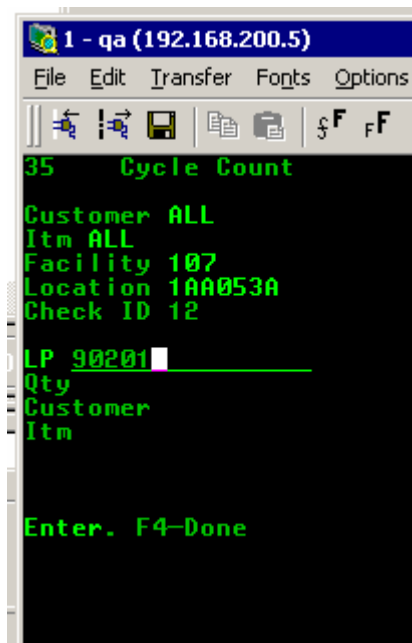

A Sample count is displayed below:

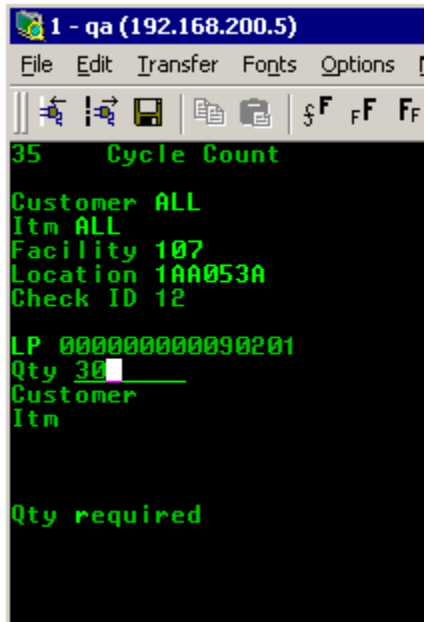

RF Operator enters the Check Digit

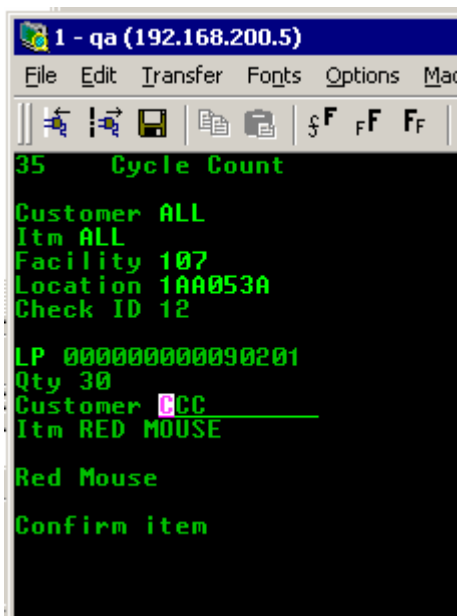

RF operator enters the plate.

RF operator enters the quantity.

RF operator uses the Enter key and the customer and item are displayed.

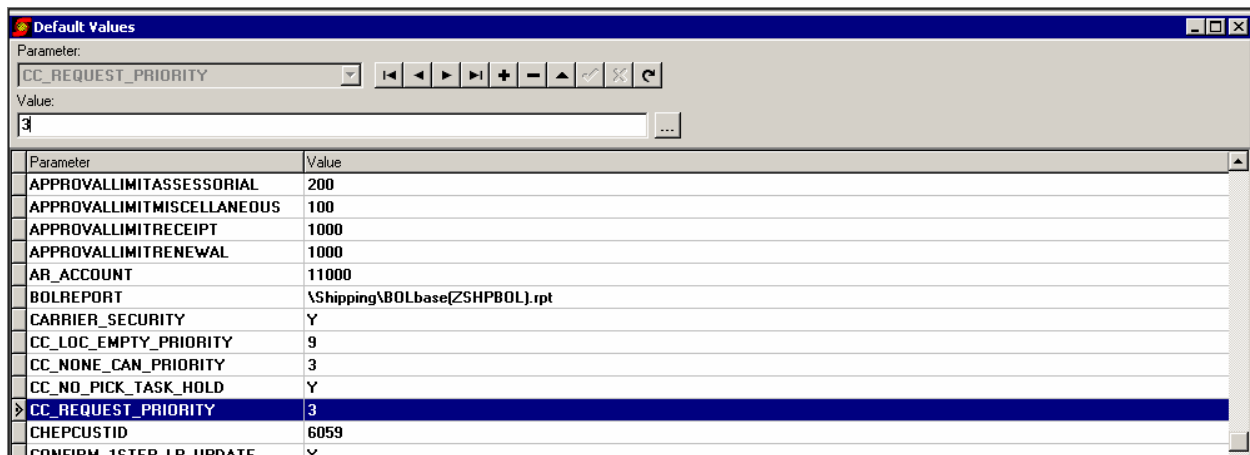

Additional Notes:

Customer ID will only be required during cycle counting if the counts are generated irrespective of customer. Therefore, if counts are created for a range of locations, customer ID will be required. If counts are created for a particular item, customer ID is not required. SUSPENSE will be used in the standard way. Multi pallets will not be countable this way.

## Cycle Count Task Priority Options

There are three system default entries that determine the priority of location count tasks that are generated during picking (all types including replenishment and sortation):

- **CC\_LOC\_EMPTY\_PRIORITY** - used when the RF operator responds with an N to the question "Is loc empty?". This is due to a situation where the system expects an empty location but the operator responds that the location is not empty.
- **CC\_NONE\_CAN\_PRIORITY** - used when the RF operator enters a valid reason on the "Can't Pick" screen under "Or No One Can".
- **CC\_REQUEST\_PRIORITY** - used when the RF operator responds with a C to the question "Alt Loc (YNC)?" after pressing F6 during picking. (\*See below). Or when the RF operator initiates a cycle count from the Location Inquiry screen.

Parameter	Value
APPROVALLIMITASSESSORIAL	200
APPROVALLIMITMISCELLANEOUS	100
APPROVALLIMITRECEIPT	1000
APPROVALLIMITRENEWAL	1000
AR_ACCOUNT	11000
BOLREPORT	\\Shipping\\BOLbase[ZSHPBOL].rpt
CARRIER_SECURITY	Y
CC_LOC_EMPTY_PRIORITY	9
CC_NONE_CAN_PRIORITY	3
CC_NO_PICK_TASK_HOLD	Y
<b>CC_REQUEST_PRIORITY</b>	<b>3</b>
CHEPCUSTID	6059
CONFIRM_1STEP_IP_UPDATE	Y

The following rules apply:

If a system default does not exist (or is deleted), the value 9 (Hold) is used.

All 3 defaults can be initialized with a value of 9.

Valid values are 1, 2, 3, 4, 9, T where:

- 1 - immediate
- 2 - high
- 3 - normal
- 4 - low
- 9 - on hold
- T - same as the priority of the current task

If any other value is entered into the default values table, the value 9 is used.

If an existing location count task exists and it has a lower (higher numerically) priority, the priority will be adjusted to the higher priority (lower number).

“Alt Loc (YNC)” Operator responses function as follows:

- Y - try to find an alternate loc but don't generate a cycle count task
- N - don't try to find an alternate loc and proceed to the Can't Pick screen
- C - try to find an alternate loc and generate a cycle count task
- F1 - exit the question and return to picking
